Electroweak baryogenesis in the three-loop radiative seesaw model with dark matter

Sora Taniguchi (U. of Osaka)

Collaborator：M. Aoki(Kanazawa U.), K. Enomoto(NTU), S. Kanemura(U. of Osaka)

Based on [JHEP06(2025)036] and recent work

Introduction

Higgs was found in 2012, but **the structure of Higgs sector is still unknown.**

The number of Higgs field, representation, symmetry, ⋯

Physics of electroweak symmetry breaking, details of phase transition

Related to BSM phenomena

- **ν oscillation**
- **Dark matter**
- **Baryon asymmetry**

Testable with various experiments

↓

Approaching new physics from Higgs physics

Q. Can we explain these 3 BSM phenomena simultaneously at TeV scale?

M. Aoki, S. Kanemura and O. Seto (2009)

→We focus on Aoki-Kanemura-Seto (AKS) model

Our purpose and work

M. Aoki, S. Kanemura and O. Seto (2009)

We evaluate baryon asymmetry based on original AKS model to explain 3 BSM phenomena

We search for parameter space which can explain 3 BSM phenomena simultaneously and test with various experiments

- **Electron electric dipole moment (EDM)**
- **Lepton flavor violation**
- **Dark matter**

-- [JHEP06(2025)036]

- **Strongly 1st order electroweak phase transition(EWPT), Baryon number**
- **Find benchmark point which can explain 3 phenomena**
- **Test with various experiments (collider, GW, DM, neutrinos, EDMs, ⋯)**

We show this model can explain 3 BSM phenomena while considering various constraints

Particle content

SM + **Extended Higgs** + **Right-handed ν**

- **Extended Higgs** → additional Higgs doublet ϕ_2 + singlet η, S^+
- **Right-handed neutrino** N_R^α $\alpha = 1,2,3$
- **Softly broken $\tilde{Z}_2$ symmetry** → suppress Flavor Changing Neutral Current
- **Exact Z_2 symmetry** → η, S^+, N_R^α are odd

	Z_2	$\tilde{Z}_2$ (Softly broken)
ϕ_1	$+$	$+$
ϕ_2	$+$	$-$
N_R^α	$-$	$-$
S^+	$-$	$+$
Dark matter → η	$-$	$-$

Type-X 2HDM + $N_R^\alpha, S^\pm, \eta$

$$\mathcal{L} \supset -\frac{\lambda_5}{2}(\phi_1^\dagger \phi_2)^2 - h_i^\alpha \overline{(N_R^\alpha)^c} l_R^i S^+ + \text{h.c.}$$

CP phase θ_5 $(\lambda_5 = |\lambda_5| e^{i\theta_5})$

$\alpha = 1,2,3$, $i = 1,2,3$, h_i^α is 3×3 complex matrix

Aoki-Kanemura-Seto model

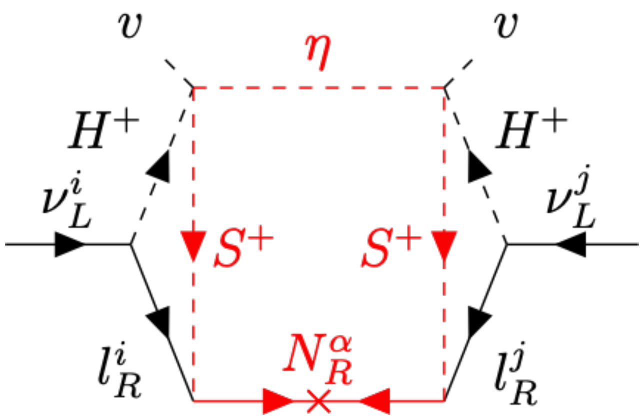
Aoki-Kanemura-Seto (AKS) model can explain 3 BSM phenomena simultaneously at TeV scale

M. Aoki, S. Kanemura and O. Seto (2009)

Z_2 **symmetry**
- **Tiny ν mass via radiative correction**
- **Dark matter candidate** (Z_2 odd neutral particle)

Baryon asymmetry：**Electroweak baryogenesis(EWBG)**

Energy scale：**TeV→Testable at collider**



3-loop neutrino mass generation

$$M_{ij} \sim \underbrace{\left(\frac{1}{16\pi^2}\right)^3}_{\sim 10^{-6}} \times \underbrace{\left(\frac{m_l}{v}\right)^2}_{\sim 10^{-4}} \times \frac{v^2}{m_N} < \text{eV}$$

$\tilde{Z}_2$ for FCNC

	Z_2	$\tilde{Z}_2$ (Softly broken)
ϕ_1	$+$	$+$
ϕ_2	$+$	$-$
N_R^α	$-$	$-$
S^+	$-$	$+$
η	$-$	$-$

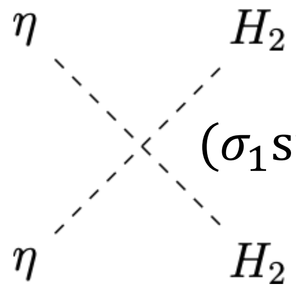
Dark matter

$$V \supset +\sum_{a=1}^{2}\left(\rho_a|\phi_a|^2|S^+|^2+\underline{\frac{1}{2}\sigma_a|\phi_a|^2\eta^2}\right)$$

η : Dark matter

DM-Higgs interaction

Dominant contribution to the relic density



$\tan\beta = 18$

$(\sigma_1 \sin^2\beta + \sigma_2\cos^2\beta) \simeq \sigma_1$

$\sigma_1 = 0.0841$

$\rightarrow \Omega h^2 \simeq 0.12$

DM direct detection

spin-independent cross section for $\eta N \rightarrow \eta N$

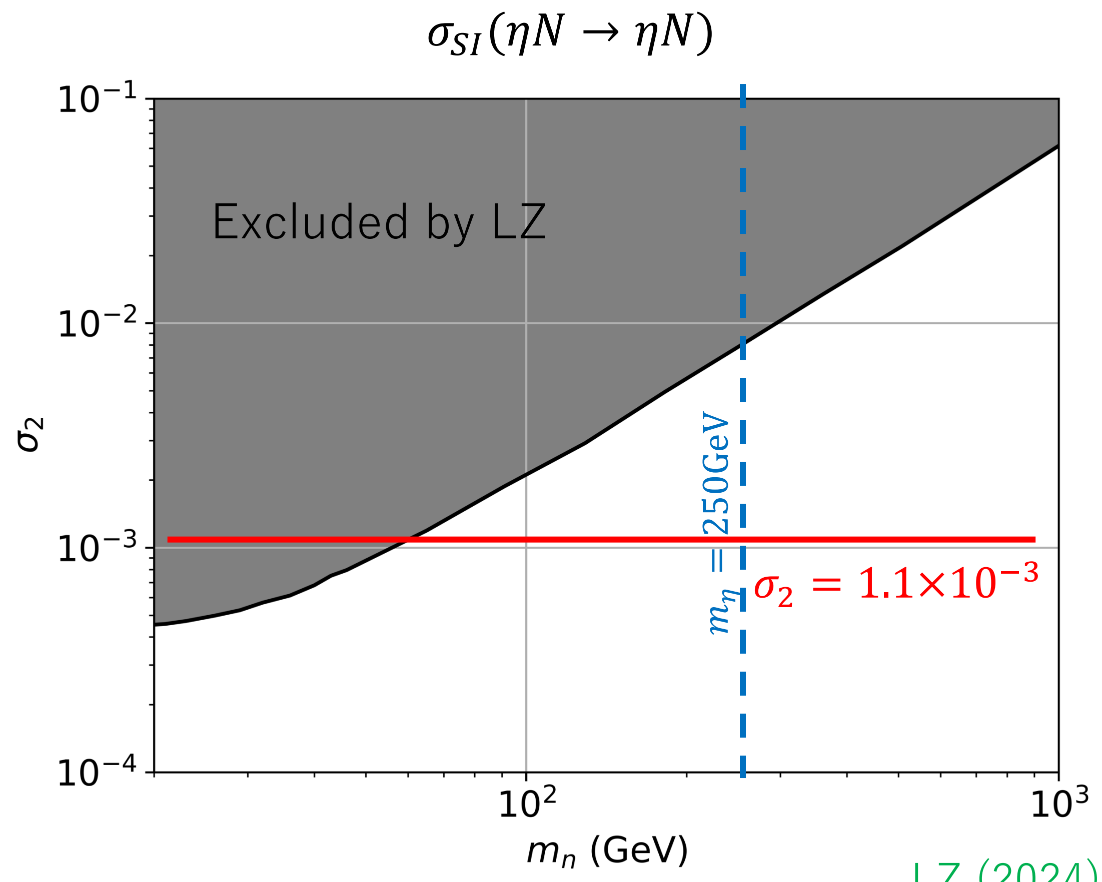
$$\sigma_{\rm SI} \simeq \frac{g^2 m_N^2 v^2}{4\pi(m_\eta+m_N)^2 m_{H_1}^4}(\sigma_1\cos\beta+\sigma_2\sin\beta)^2$$

$m_N \simeq 1$ GeV : nucleon mass

$g \simeq 10^{-3}$: coupling for nucleon-Higgs

Shifman, et al (1978)

$(\sigma_1 \cos\beta + \sigma_2 \sin\beta) \simeq \sigma_2$



LZ (2024)

K. Enomoto, S.Kanemura, ST (2024)

Electroweak Baryogenesis

Electroweak Baryogenesis

Kuzmin, Rubakov and Shaposhnikov (1985)

(1) B violation → **Sphaleron Transition**

(2) C, CP violation → **CP violation in extended Higgs sector**

(3) Departure from thermal equilibrium Sakharov (1967) → **Sphaleron decoupling →Strongly 1st order EWPT**

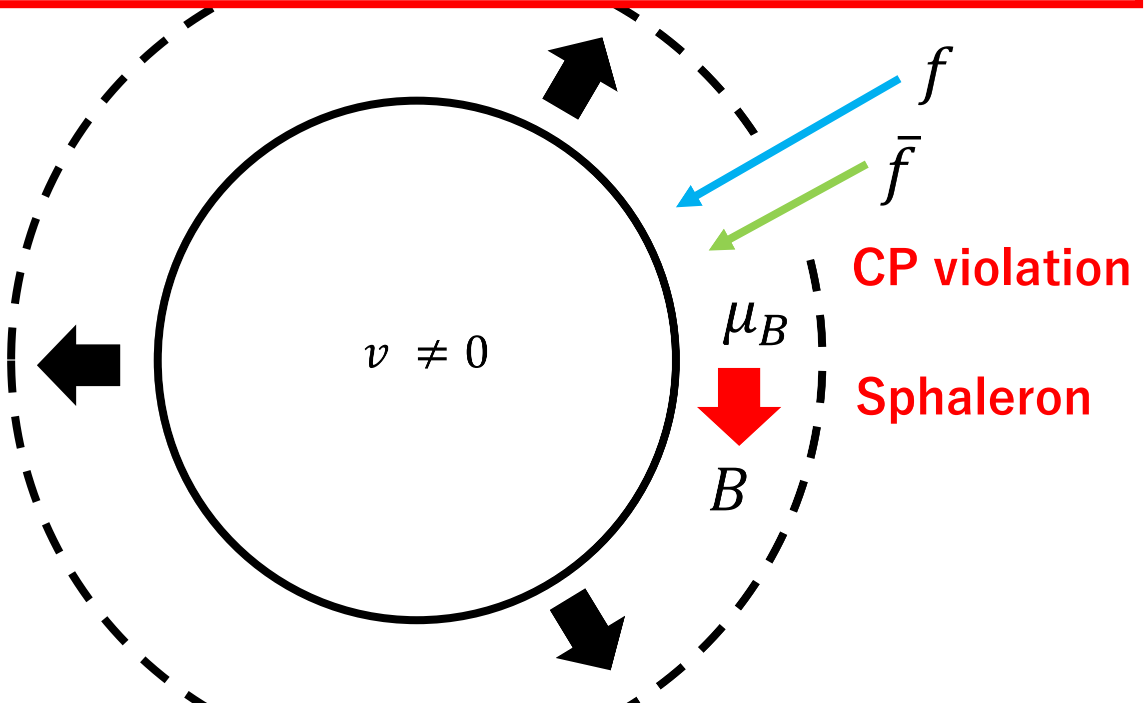
Charges accumulate around the bubble wall due to the CPV

↓

B number is generated by sphaleron

↓

Sphaleron decouples inside the bubble wall and B number remains

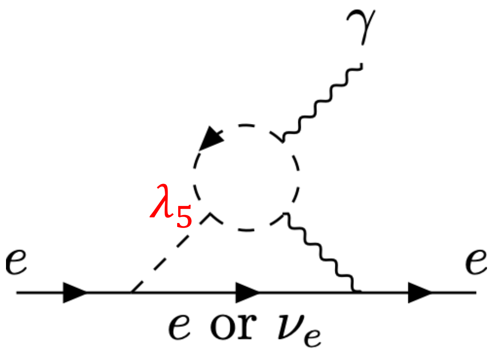


Electric dipole moment in our model

Sufficient CP phase ($\theta_5 \sim O(1)$) for EWBG is severely constrained by electron EDM experiments ($|d_e| < 4.1\times10^{-30}$ ecm).
Roussy et al. (JILA) (2023)

$$\mathcal{L} \supset \; - h_i^\alpha \overline{(N_R^\alpha)^c} l_R^i S^+ + \text{h.c.}$$

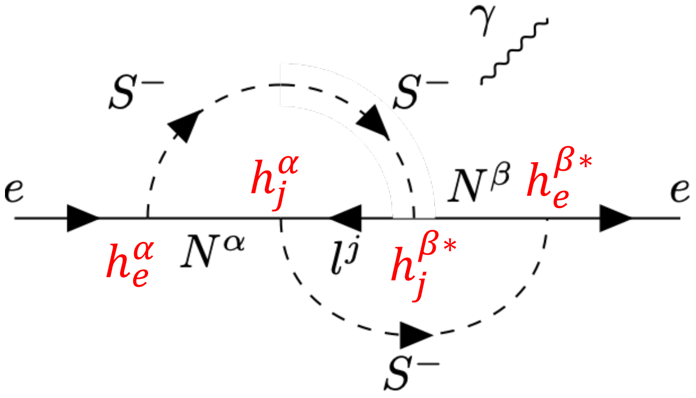
Electron EDM can be small by considering following contribution



Barr, Zee (1990)
Altmannshofer, et al(2020)

Contribution in 2HDM
(Barr-Zee contribution)

+

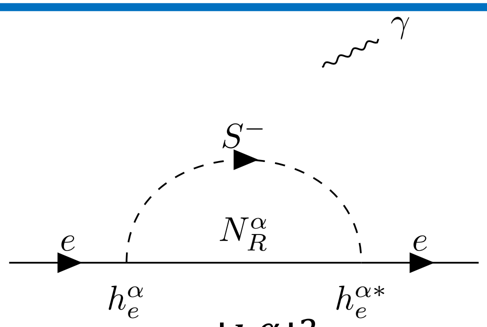


Additional contribution in CPV AKS model

$< 4.1\times10^{-30}\ ecm$

$|d_e| \simeq \mathbf{8.3 \times 10^{-31}}\ ecm < 4.1\times10^{-30}\ ecm$

$\theta_5 \simeq -0.090\pi$



$\propto |h_e^\alpha|^2$

Imaginary part = 0 in 1-loop

Strongly 1st Order Phase Transition

Sphaleron decoupling → $\Gamma_{sph}^{br} < H(T_c)$

Γ_{sph}^{br}:Sphaleron rate in broken phase
$H(T_c)$:Hubble const. at transition temp.

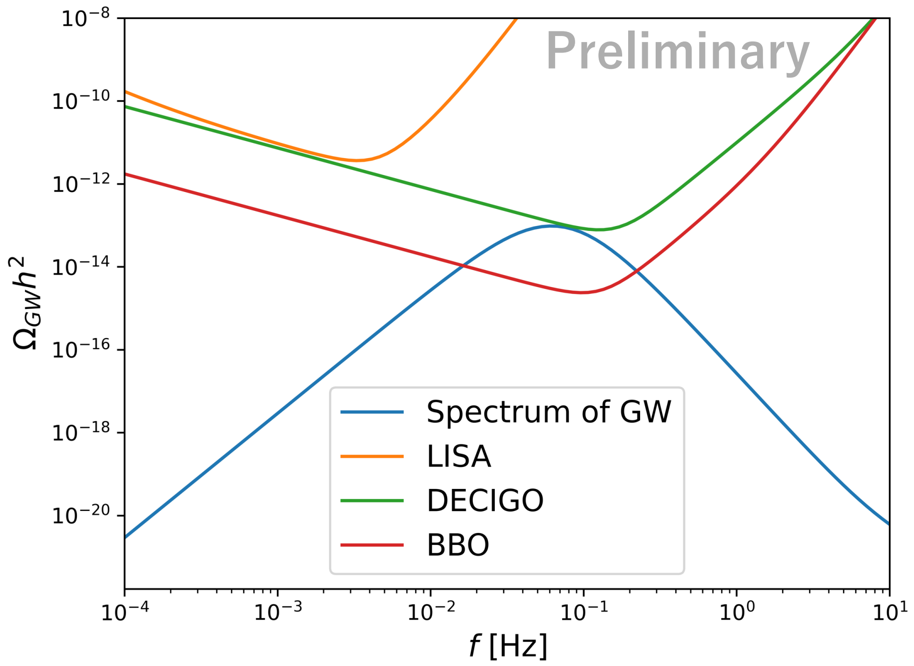
➡ **Strongly 1st order EWPT** $\frac{\varphi_c}{T_c} > 1$

→non-decoupling effects of additional scalars

This effect gives a large deviation in hhh coupling

Kanemura, Kiyoura, Okada, Senaha, Yuan (2002)
Kanemura, Okada, Senaha, Yuan (2004)

$$\Delta R \equiv \frac{\lambda_{hhh} - \lambda_{hhh}^{SM}}{\lambda_{hhh}^{SM}} \simeq 36\ \%$$

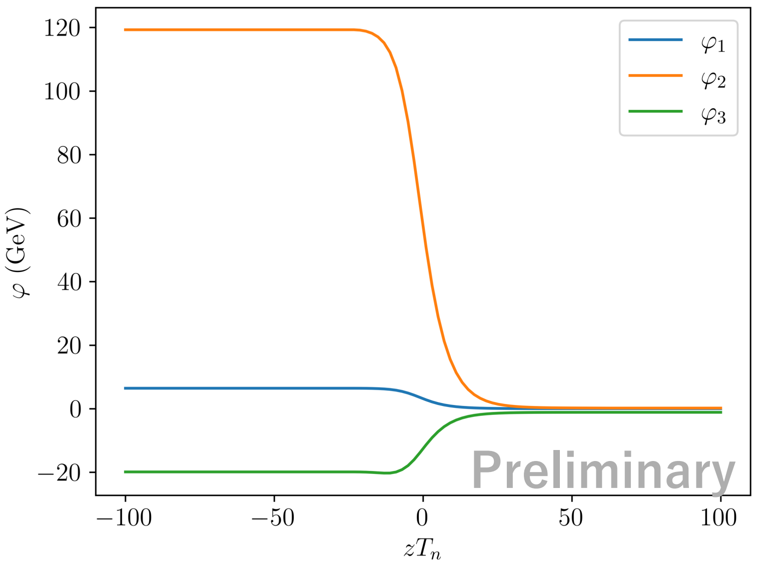


GW from strongly 1st order EWPT

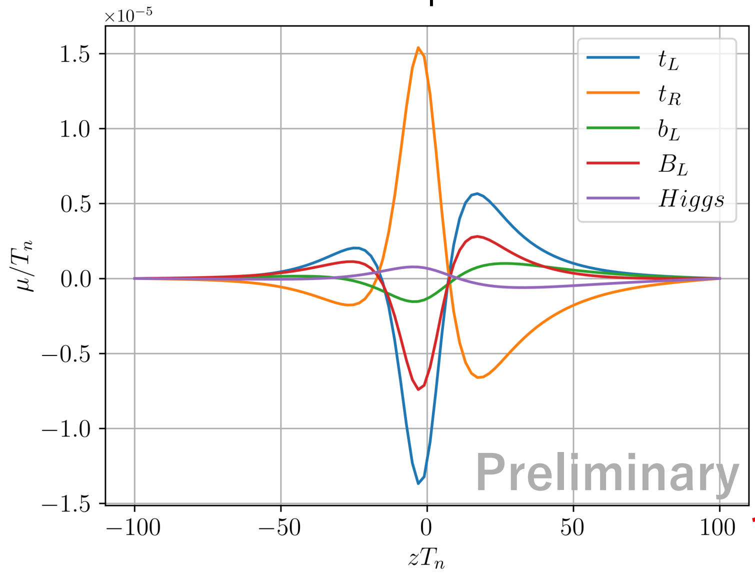
→**testable at BBO,DECIGO**

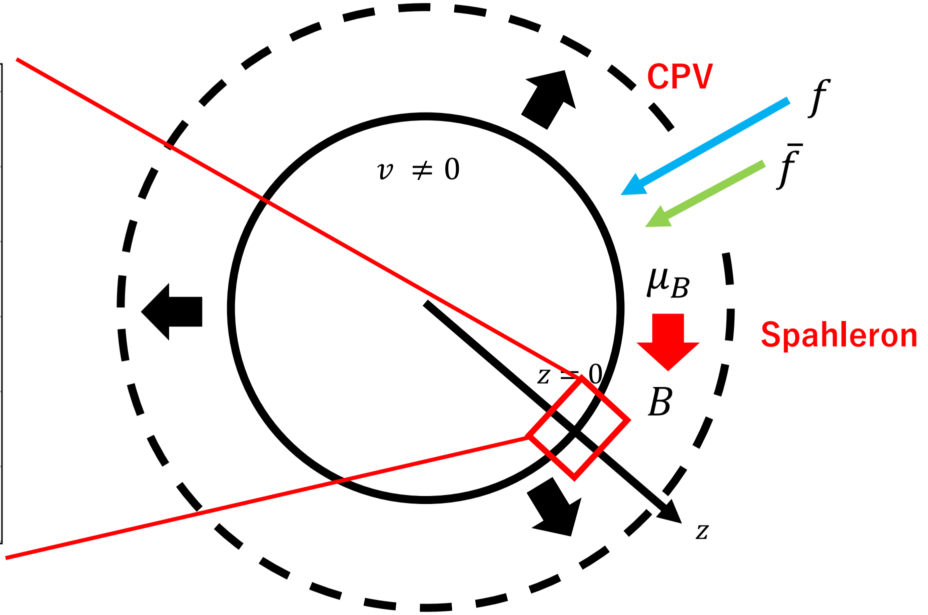
Baryon asymmetry

Bubble profile



Chemical potential





Top transport scenario with WKB approx.

CosmoTransition

Wainwright (2011)

Cline, Joyce, Kainulainen (2000)
Fromme, Huber (2006)
Cline, Kainulainen (2020)

$$\phi_1^{cl} = \frac{1}{\sqrt{2}}\begin{pmatrix} 0 \\ \varphi_1 \end{pmatrix}$$

$$\phi_2^{cl} = \frac{1}{\sqrt{2}}\begin{pmatrix} 0 \\ \varphi_2 + i\varphi_3 \end{pmatrix}$$

Chemical potential outside the wall convert to baryon asymmetry by Sphaleron

$m_{H^1} \simeq 125$ GeV, $m_{H^2} \simeq 207$ GeV,
$m_{H^3} = m_{H^\pm} \simeq 373$ GeV
$M \simeq 210$ GeV, $m_S = 325$ GeV,
$\mu_S = 20$ GeV, $\theta_5 \simeq -0.090\pi$

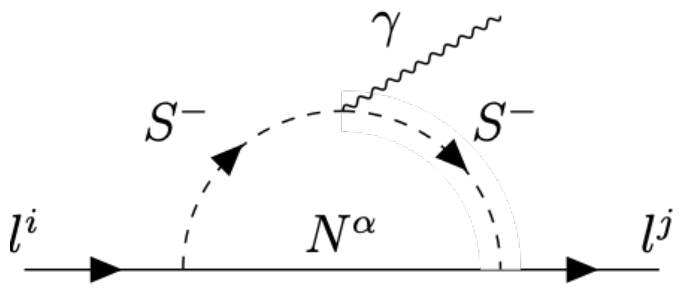
Observed : $\eta_B = \frac{n_B}{n_\gamma} = (6.04 - 6.20)\times 10^{-10}$ From CMB Planck (2018)

$$\eta_B \simeq 6.07\times 10^{-10}$$

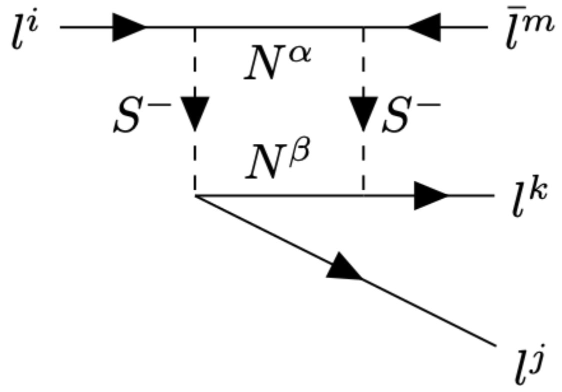
M. Aoki, K. Enomoto, S.Kanemura, ST (2025)

Lepton flavor violation

$l^i \to l^j \gamma$



$l^i \to l^j\, l^k\, \bar{l}^m$



K. Enomoto, S.Kanemura, ST (2024)

	Prediction	Exp. bounds	
$\mu \to e\gamma$	2.3×10^{-14}	3.1×10^{-13}	MEG-II(2024)
$\tau \to e\gamma$	1.8×10^{-11}	3.3×10^{-8}	BaBar(2010)
$\tau \to \mu\gamma$	2.0×10^{-17}	4.4×10^{-8}	BaBar(2010)
$\mu \to 3e$	1.0×10^{-13}	1.0×10^{-12}	Mu3e(2023)

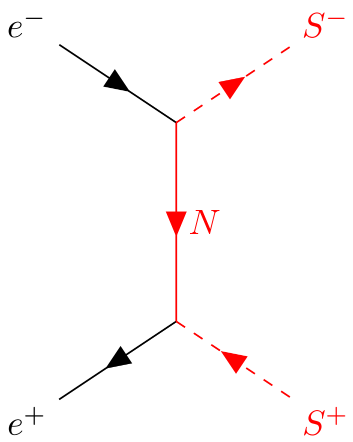
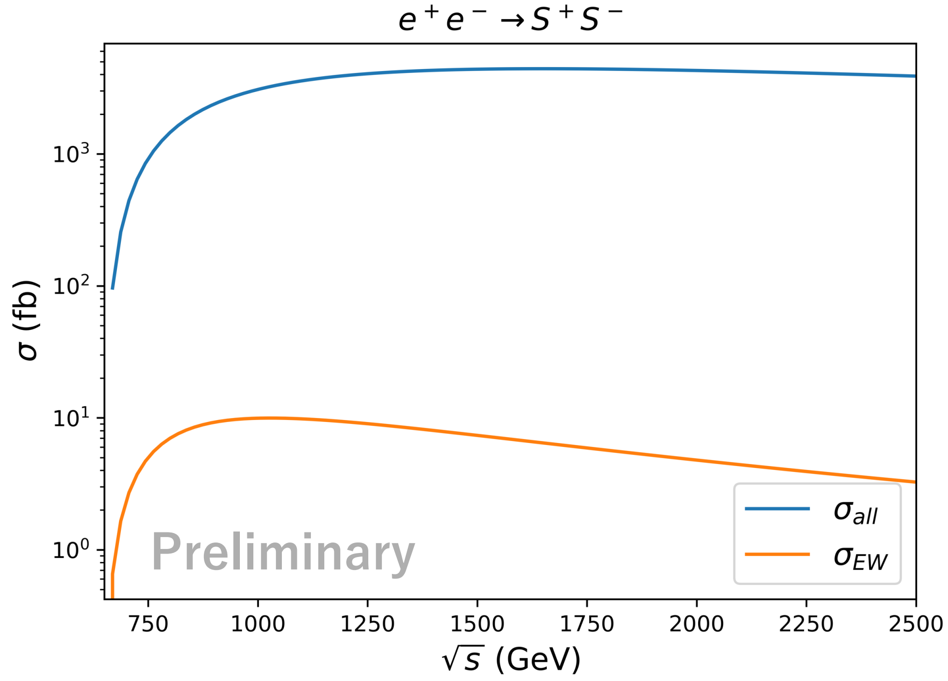
$\tau \to \mu\mu\bar{e}$	1.4×10^{-17}	1.7×10^{-8}	Belle (2010)
$\tau \to e\mu\bar{\mu}$	8.3×10^{-19}	2.7×10^{-8}	Belle (2010)

Phenomenology in collider experiments

$S^{\pm}$ Production

Production : Drell-Yan process
t-channel process
(lepton collider)





$S^+ \to H^{\pm *}\eta \to \tau\nu\eta$ is the main decay channel
$e^+e^- \to S^+S^- \to \tau\bar{\tau}E$ (E : missing energy)

LHC can produce $S^{\pm}$ by Drell-Yan process

$pp \to S^+S^-$ (MadGraph)

$\sqrt{s} = 13$ TeV : $\sigma = 0.976$ fb

$\sqrt{s} = 14$ TeV : $\sigma = 1.14$ fb

Additional Higgs H_2, H_3 can be tested at future HL-LHC by

$H_2, H_3 \to \tau\bar{\tau}, t\bar{t}$ $\quad$ $H_2, H_3 \to ZH_1, H_1H_1$

Summary

- AKS model can explain 3 BSM phenomena simultaneously at the TeV scale.
- **We introduce CP violation into the original AKS model (2009).**
- **We evaluate the baryon number and confirm that it can explain current observed data.**
- **We find the benchmark point to explain 3 BSM phenomena while avoiding several constraints.**
- **Prospects**
    - Test with various experiments (collider, flavor, DM, neutrinos, EDMs, GW, ⋯)
