

# The GRAND project Status report

GRAND collaboration meeting

Warsaw University

June 2nd, 2025

Kumiko Kotera, Olivier Martineau, XiangPing Wu

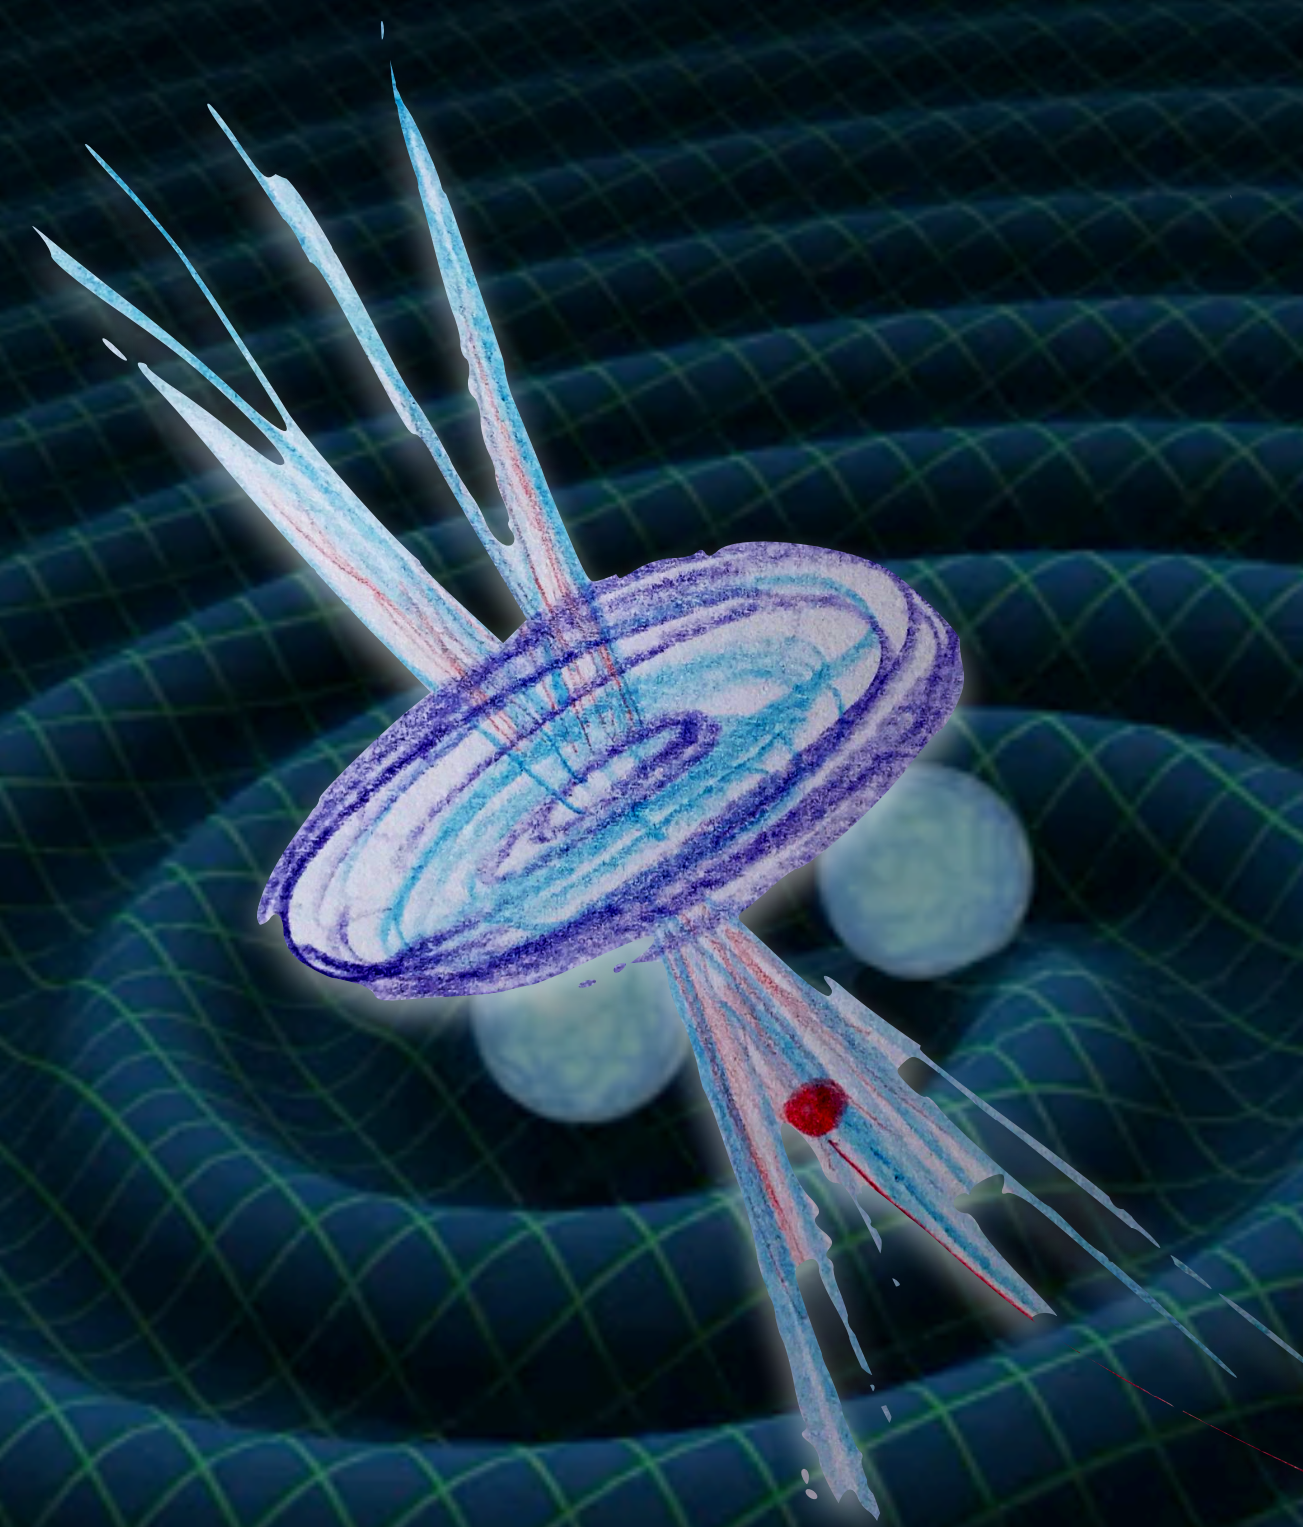

# Multi-messenger astronomy : understanding the Violent Universe

light

gravitational  
waves

$\nu$   
neutrinos

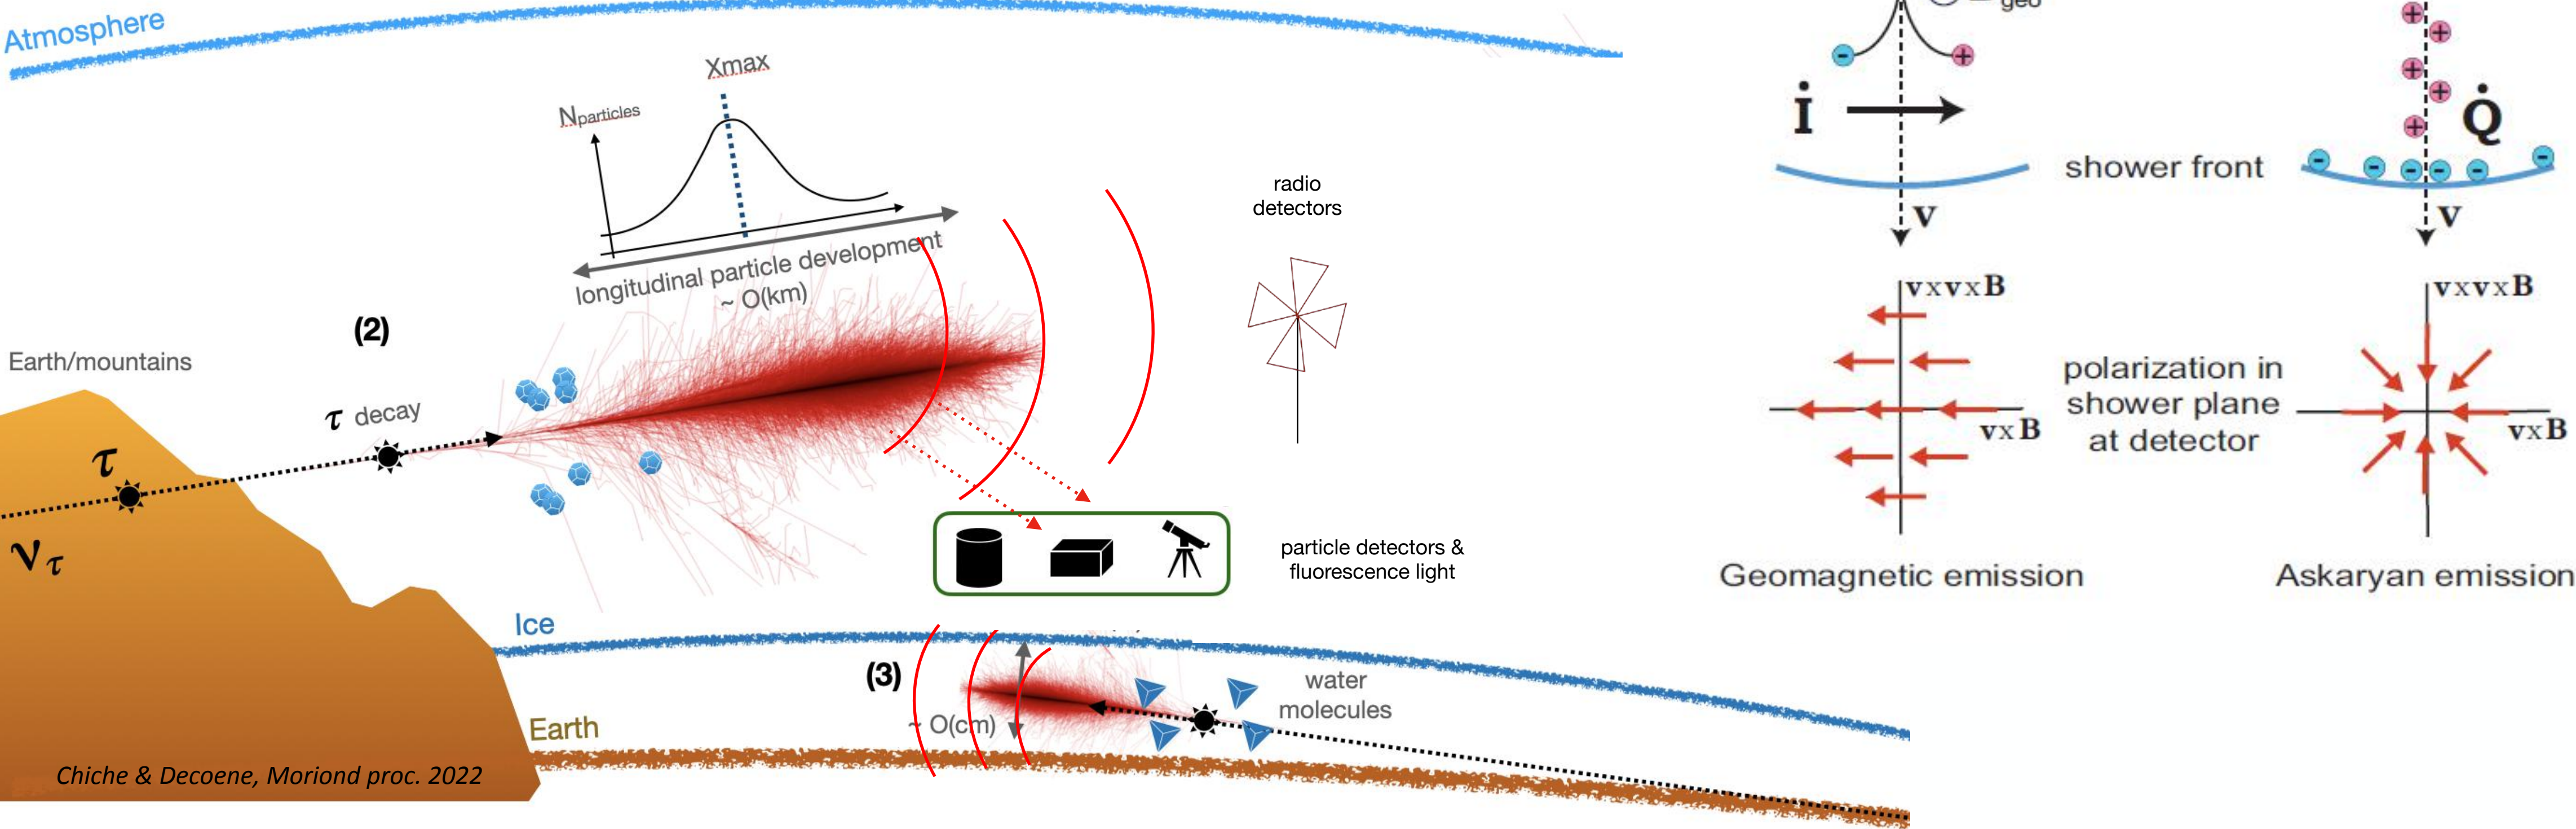

cosmic rays

# Radio detection as a cost-effective technique

- Radio antennas: cheap, robust, scalable
  - 100% duty cycle
  - benchmarked technique
- in-ice & in-air for specific configurations

Performances	instantaneous sensitivity	daily aver. sensitivity	iFoV	dFoV	angular resolution
in-ice	+ wide & shallow	++	+++ wide & shallow	++ no gain by Earth rotation if South Pole	+ reconstruction of polarization difficult
in-air	+++ deep & narrow	++ equivalent as experiments tuned to diffuse flux	+ deep & narrow	+++	+++ large footprints

# Challenges of radio-detection

## Deployment over large/challenging areas

- quiet site identification + geopolitics
- logistical challenges

## Complexity & efficiency trade-off

- Number of channels
- Phasing or not
- Low noise system
- Robust for desert/ice environments & temperature fluctuations
- Simple deployment for large numbers

## Reconstruction of shower parameters

- Different physics, asymmetries, ground reflections... for very inclined air-showers, in-ice propagation
- New reconstruction methods to develop & test

## A good radio detector?

*by Abby Vieregg*  
*GRAND-BEACON Workshop*  
*PSU, Jan. 2024*

- antenna collecting area (number & gain of antennas)
- trigger threshold (reducing system noise, smart triggering and noise rejection)
- collecting enough information so that events can be separated from background in analysis

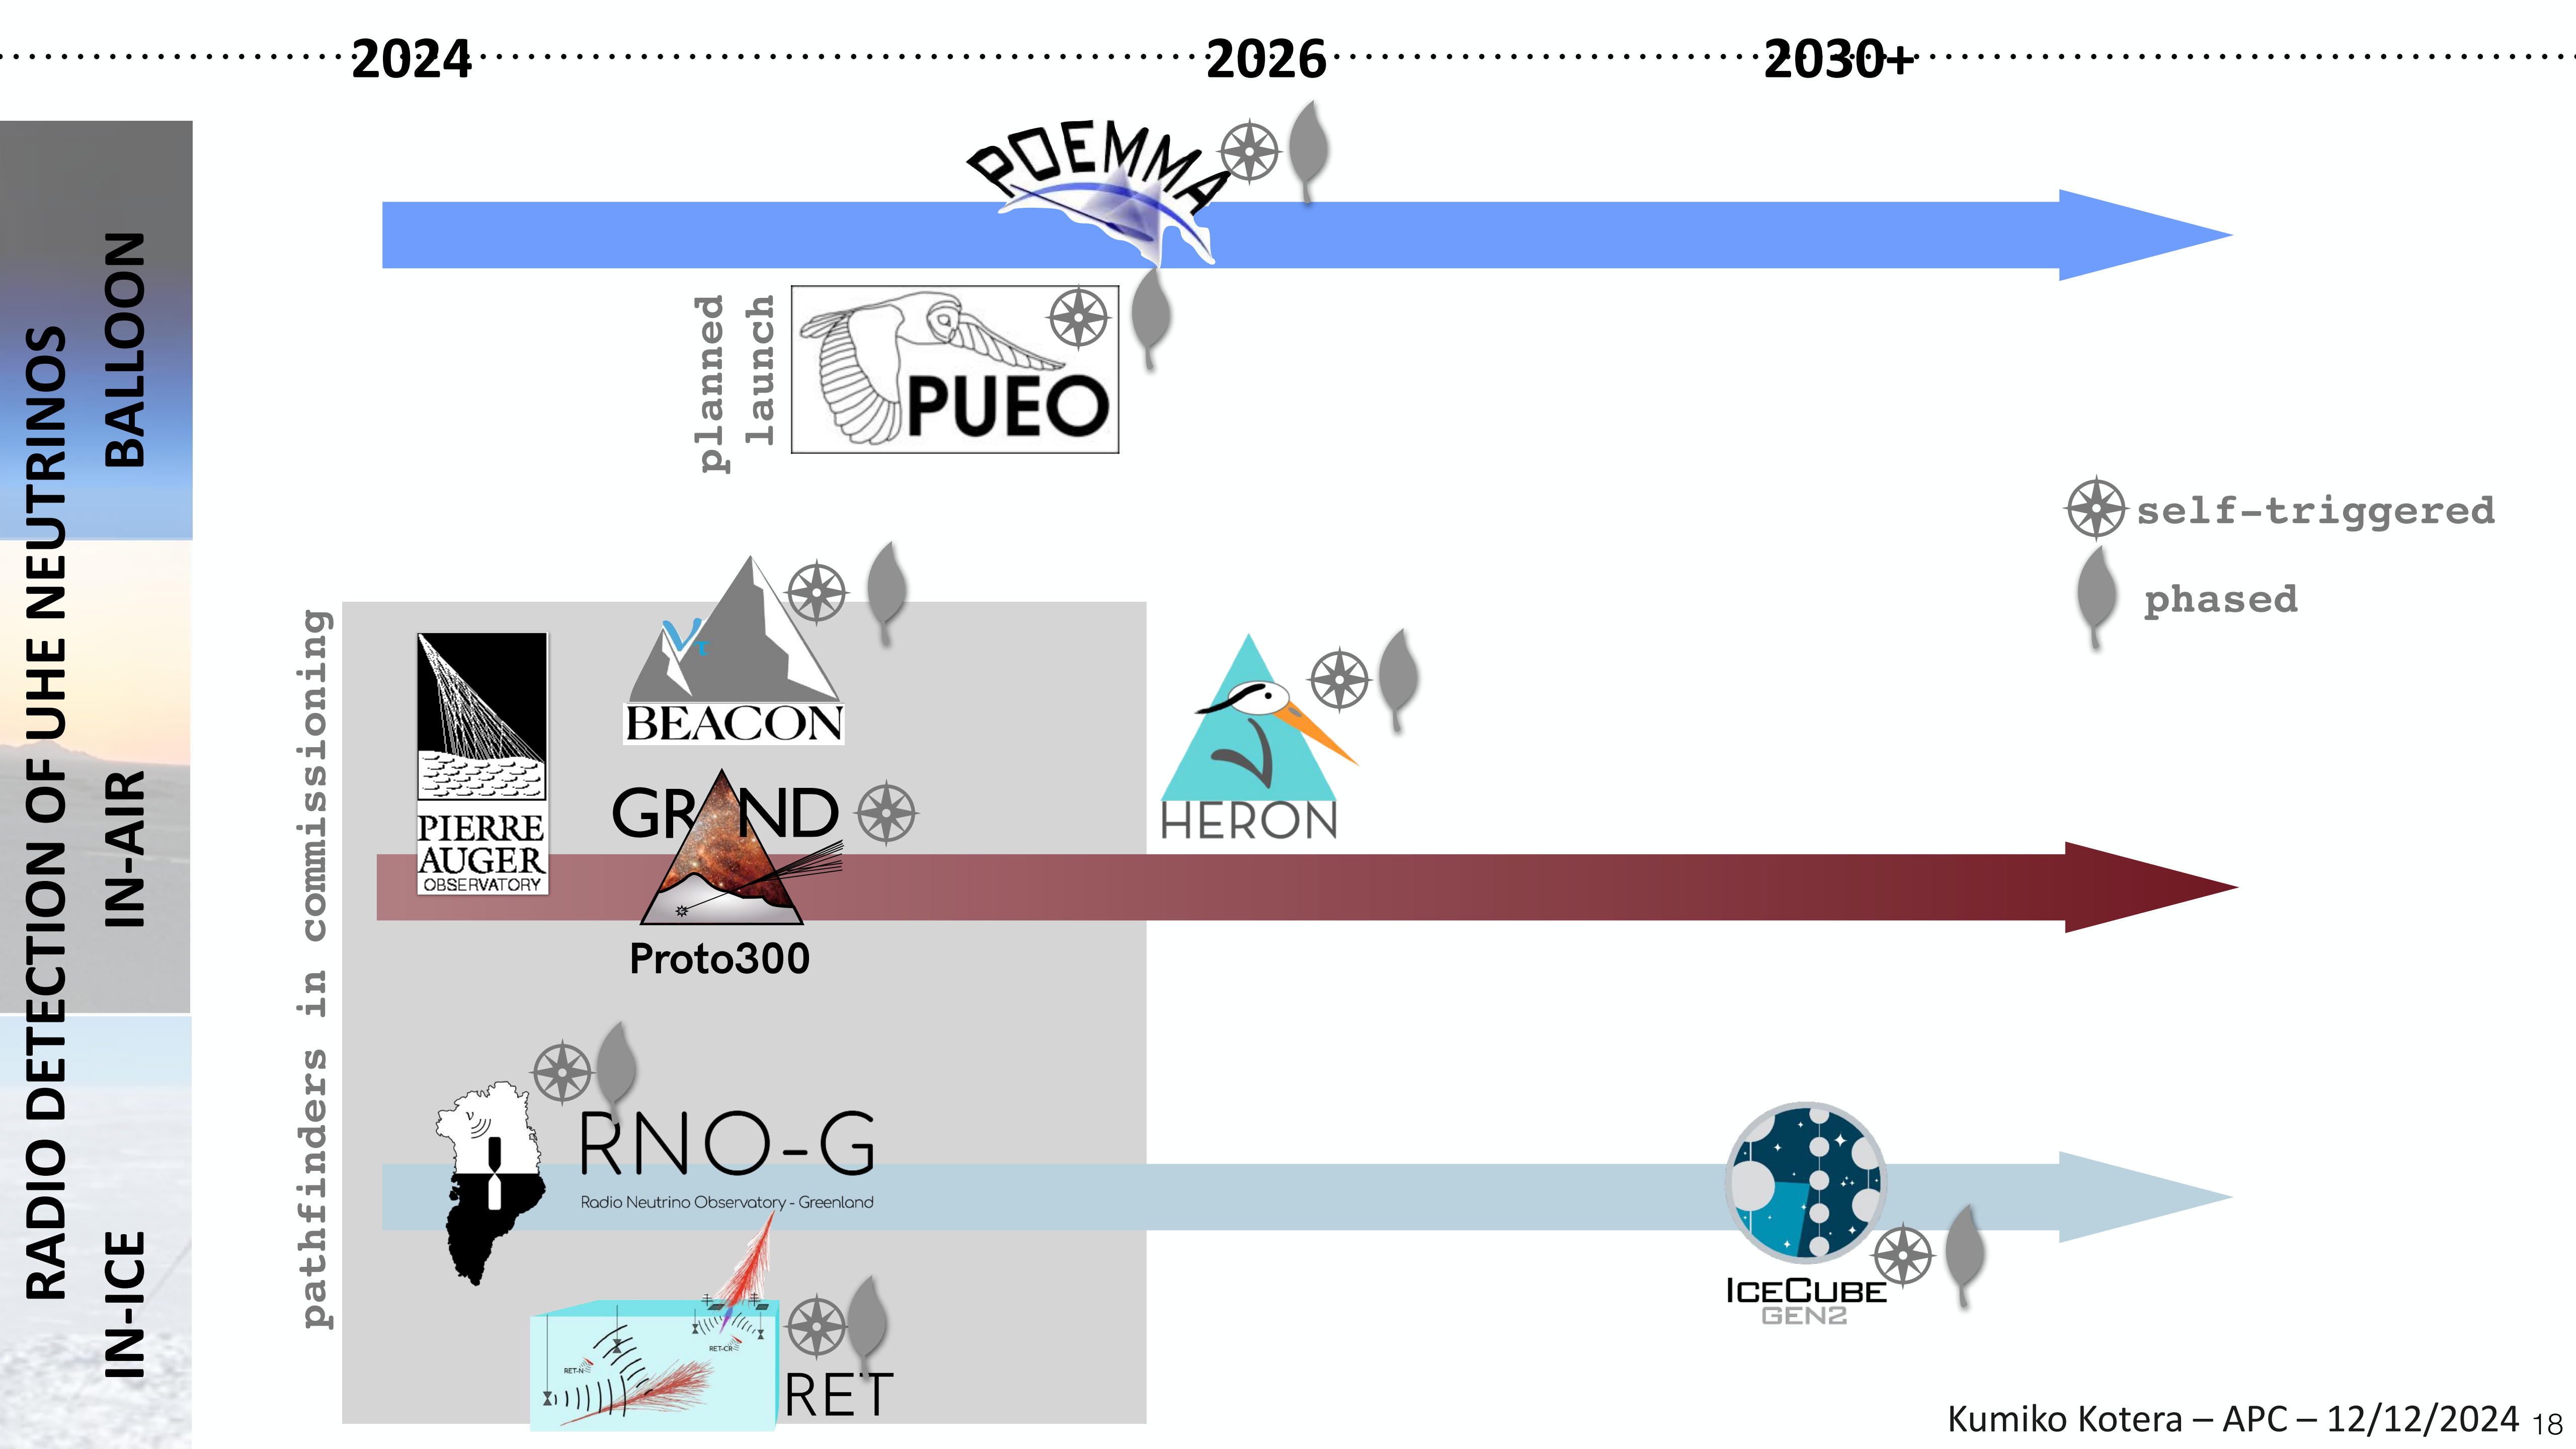

## RFI discrimination & autonomous triggering on radio signals

- Ultra-dominant noise: ideal quiet sites
- New electronics necessary: high sampling rate & autonomous triggering
- Identification of signals & denoising methods
- Previous successful efforts in other contexts: ANITA, TREND

## Data volume & transfer: low-rate, low-power

- Huge data volume (currently on GRAND prototype ~10 kBy/trigger)
- Online treatment to reduce stored information (trigger time, amplitude, polar...)

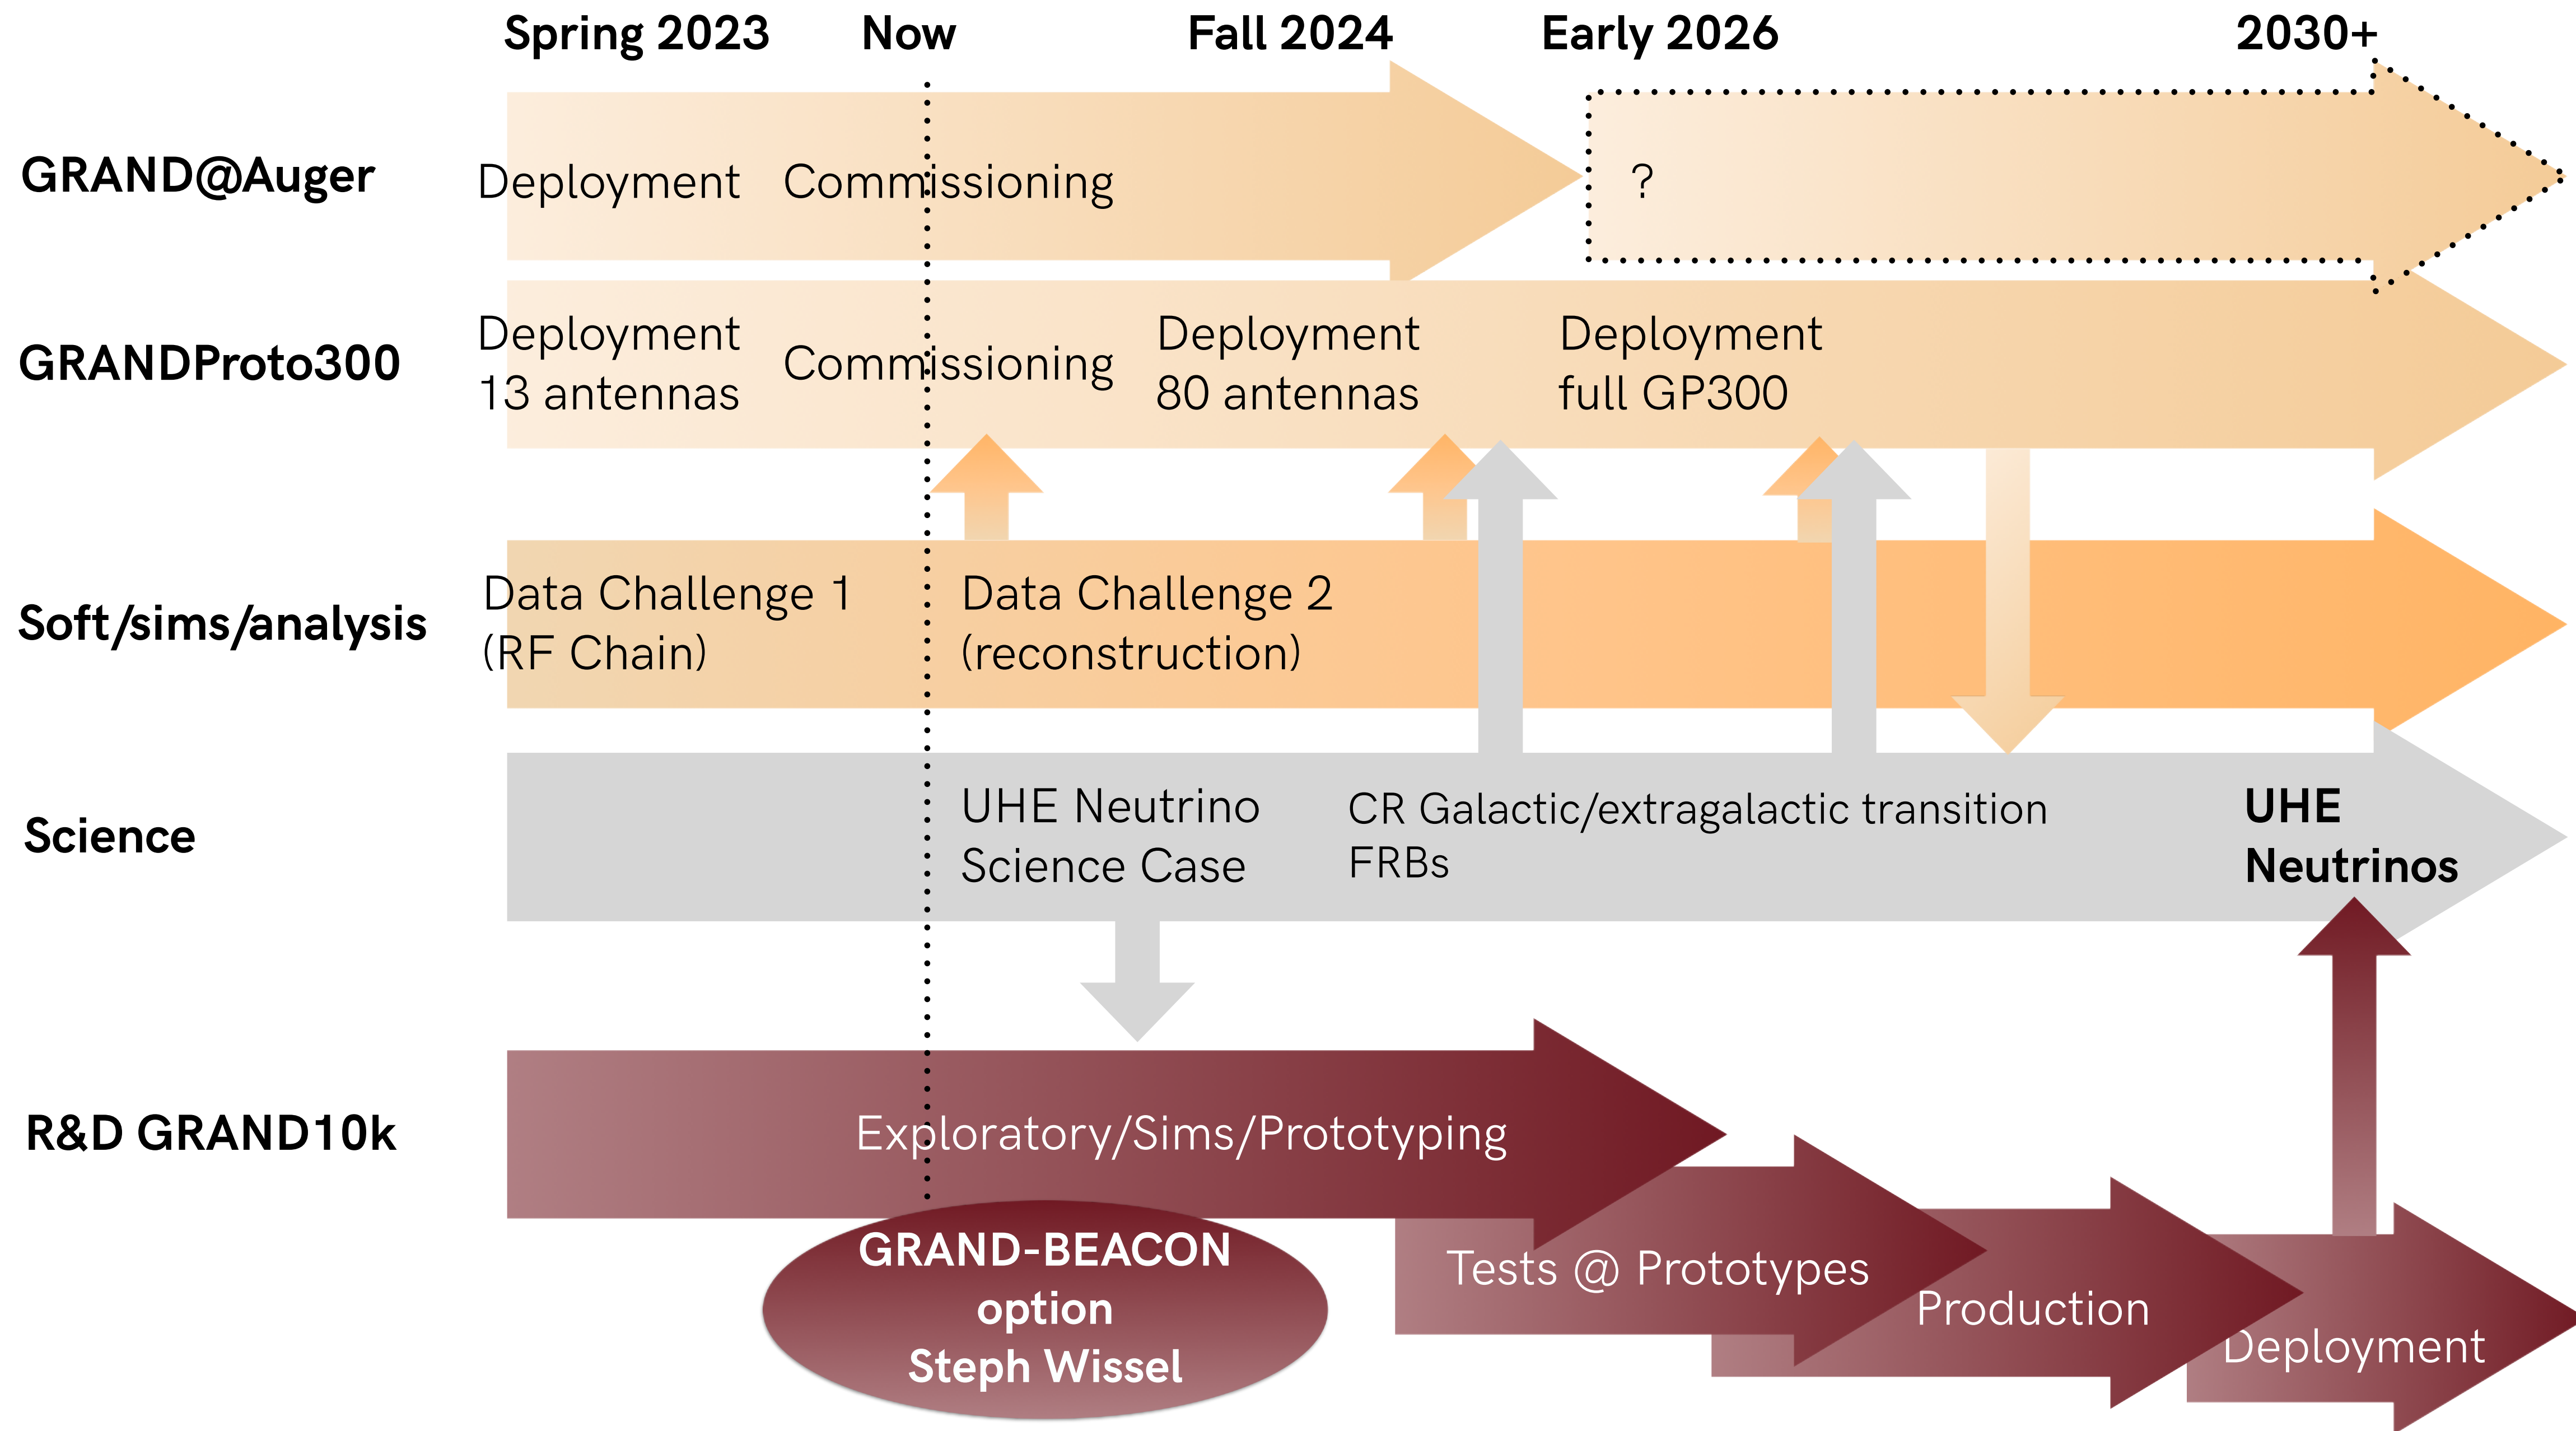

# Ideal Timeline

Nanjing Coll. Meeting 2024

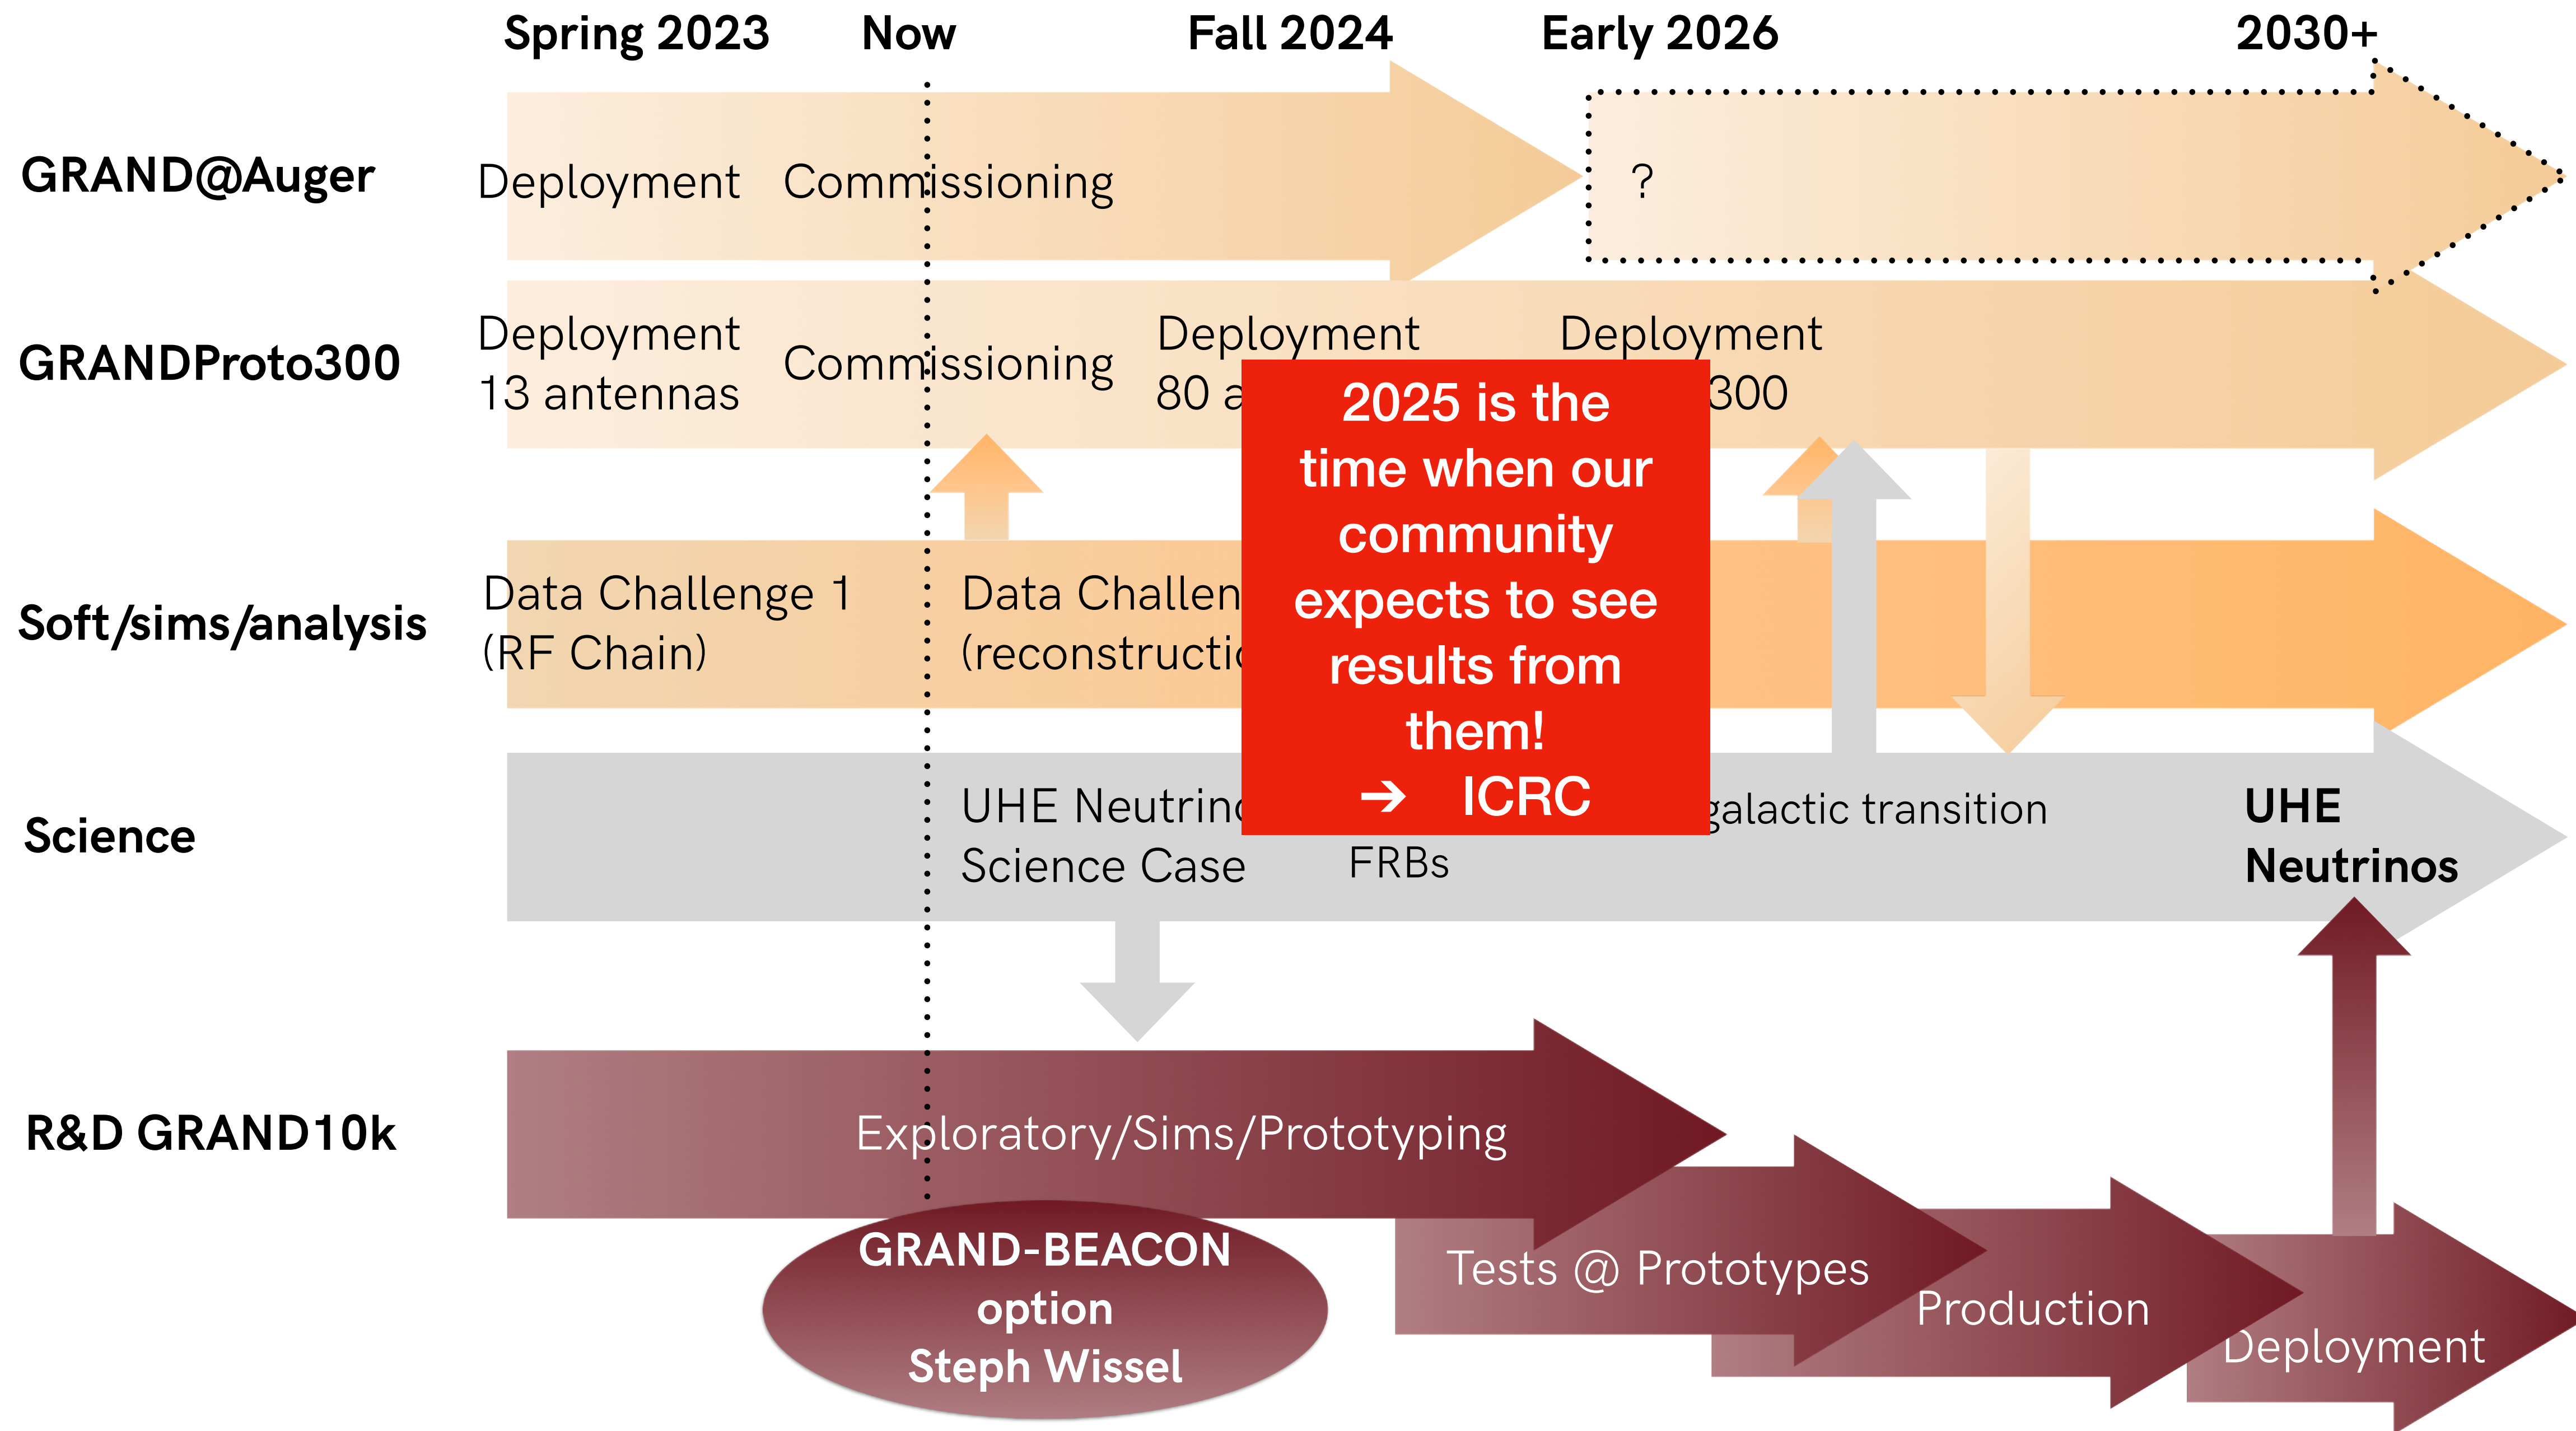

# Ideal Timeline

Nanjing Coll. Meeting 2024

# Challenges of radio-detection

# The GRAND prototypes: GRANDProto300

- GRANDProto13 deployed Feb 2023 – dismantled April 2025
- GRANDProto80 deployment started Sep 2024. 60 DUs today.
- Over past 3 years, tremendous effort on deployment and commissioning to fix issues and understand our detector (XiDian & PMO)
  - Thermal heating → GP300 status, Monday pm,
  - Self-made noise → GP300 operation + trigger Wednesday pm
  - Triggers T1 and T3 → GP300 calib Thursday pm
  - DAQ
  - Data transfer / management
  - Stability (temperature / ressource)
  - Time and amplitude calibration
  - Environment study (planes, mine)
- ... Yet not fully satisfying:  
today only ~5 antennas running!

## 115MHz幅度响应、脉冲测试

Pengxiong & Xu Xin

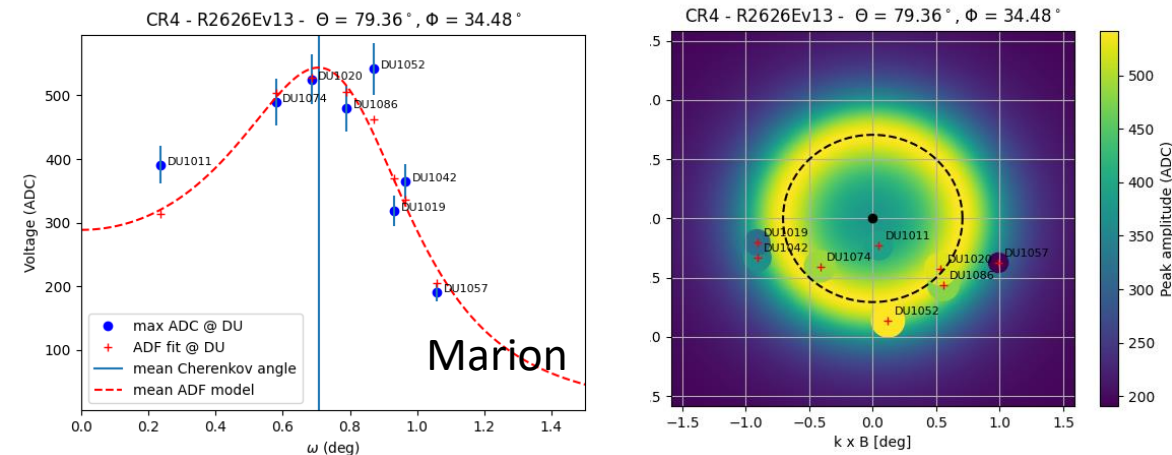

# GRANDProto300 cosmic ray candidates

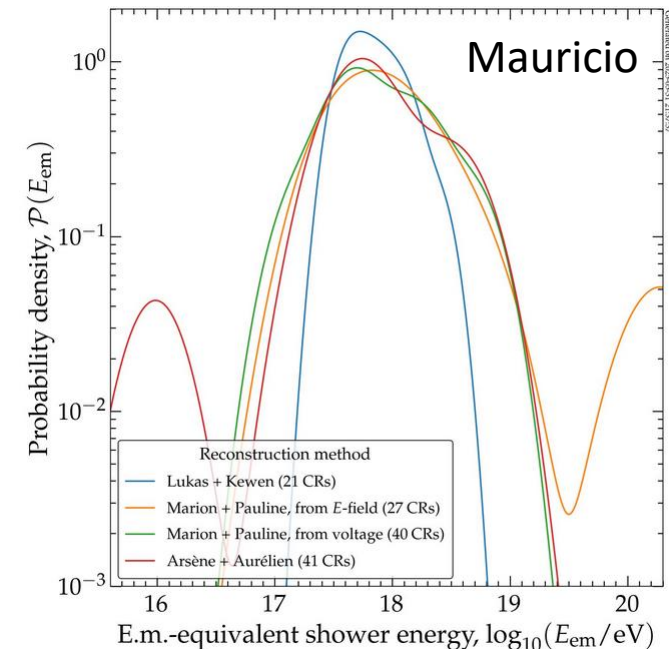

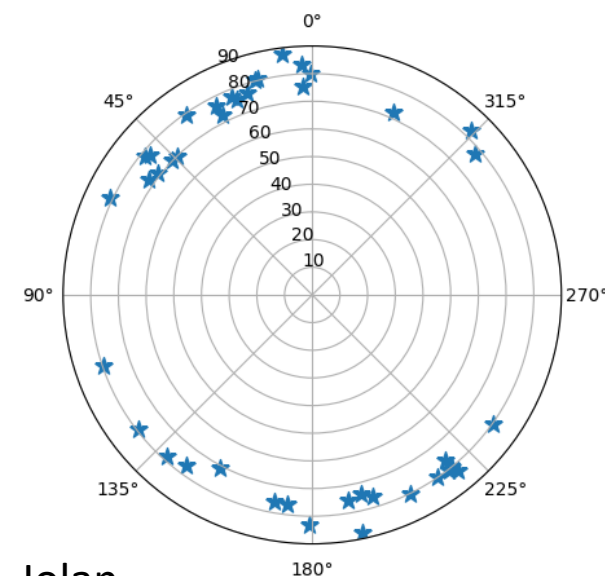

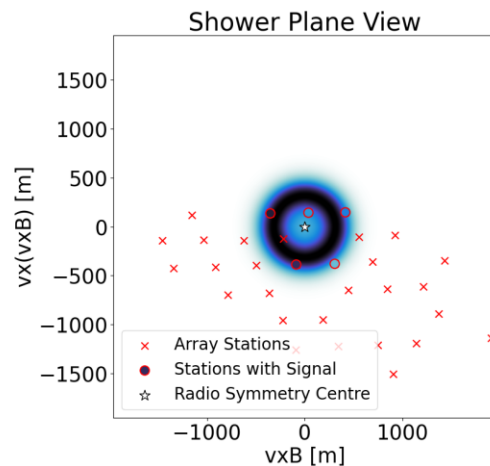

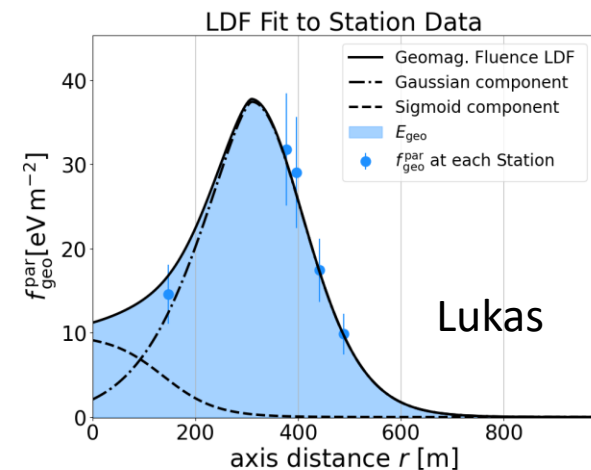

→ Analysis + CNN Tuesday

→ CR analysis pipeline Thursday pm

Very active working group #cr\_search  
(coordinator Mauricio):  
41 candidate selected, ~30 with successful  
reconstruction. Coherent distribution for direction and  
energy.

(Run 6222, Event 1):  $E_{\text{em}}^{\text{rec}} = 0.37 \pm 0.02 \text{ EeV}$ ,  $d_{\text{max}}^{\text{fit}} = 31 \pm 13 \text{ km}$   
 $\theta = 70.4^\circ$ ,  $\phi = 52.4^\circ$ ,  $\alpha = 91.3^\circ$

Lukas

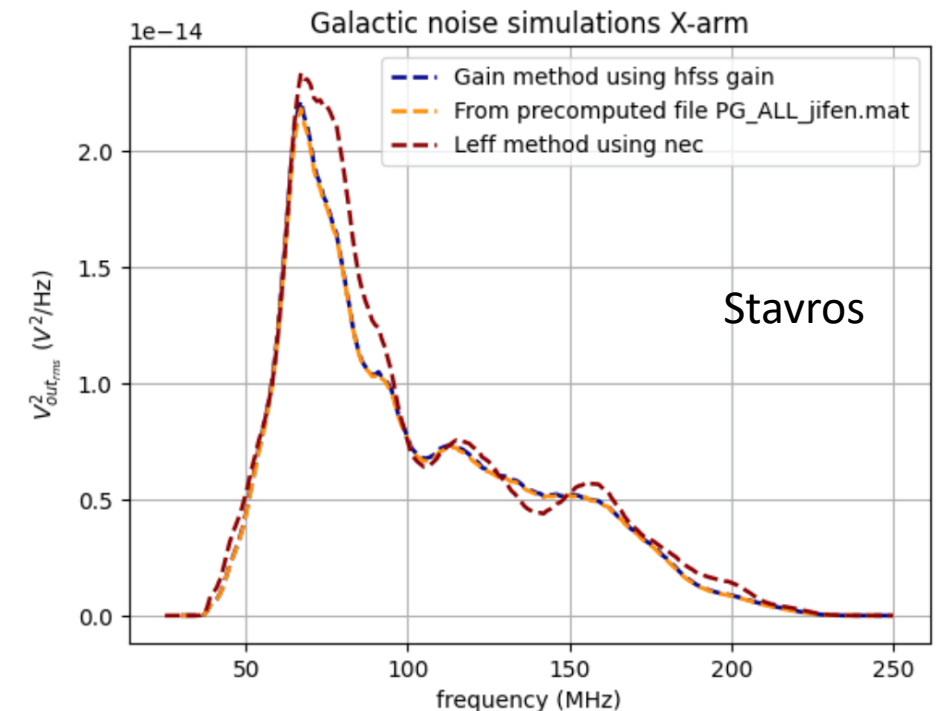

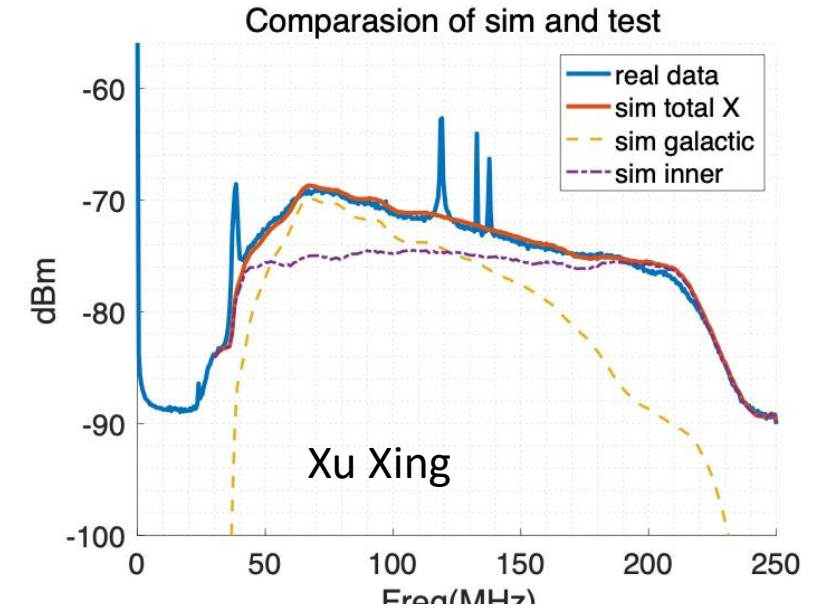

# GRAND sims and soft

- Long term effort by **very few individuals** (in particular: Matias, Lech, Ramesh) to provide proper tools for data analysis
  - GRANDlib
    - Topography management
    - Referential management
    - Data handling
    - Antenna response + RF chain model
  - DC2: 3 years of effort to provide realistic simulations of the GRAND detectors
- Work still needed, in particular for better documentation, ease of access (eg Docker/conda/Mac...) and checking validity!

→ use it and give feedback!

→ Software and sims + hands-on Thursday am

# The GRAND prototypes: GRAND@Auger

- 10 DUs deployed in 3 trips between Nov 2022 and Nov 2023 (Charles, Beatriz and Juan-Pablo)
- Stability issues:
  - Power supply
  - Heating
  - Lack of time on site
  - ➔ Limited time with 4+ DUs running together
- Yet galactic fluctuation visible & one candidate identified in coinc with Auger

# What's next?

- GP80
  - Reach stable operation on GP80 within weeks
  - Improve detection efficiency (Trigger? Data transfer?)
  - Detect hundreds of CRs/day → Science session Monday pm
  - Validate GRAND detection principle & perform CR (+ gamma?) study
- G@A ?
- GP300 extension / GRAND10k → R&D session Wednesday pm
- ... GRAND200k → Science session Monday pm
- Funding: → Collab life session Wednesday am
  - running costs to be implemented on GP300 in 2025
  - Application for funding for GP300 completion/G10k R&D phase

# The collaboration meeting: a key moment in collaboration life

- LPNHE Feb 2015
- IAP May 2017
- Nijmegen Feb 2018
- DunHuang April 2019
- Karlsruhe Feb 2020
- LPNHE Dec 2021
- Nijmegen Jan 2023
- Nanjing May 2024
- Warsaw June 2025
- ... Many more to come 😊 !

# GRAND collaboration life

- We built collaboration tools up to 2024: MoU, forums, digital tools (Wiki / Forge / Mattermost, box)
  - **Yet these can surely be improved! GRAND is YOUR collaboration (and we are only the spokespersons, not the PIs). Speak up!**
  - We work in an environment which can be challenging: pressure for results, publications, funding, recognition,... cultural differences, communication issues...
- ➔ We have to work at maintaining a collaborative, open spirit where people & work blossom**

➔ Collab life session Wednesday am

Enjoy your week in Warsaw and  
many thanks to the LOC!!!
